

BC Hydro Sustainment Project

Peace to Kelly Lake Stations Sustainment Project (PKSP) — Overview

What the Project Is

The **Peace to Kelly Lake Stations Sustainment Project** (formerly known in part as a renewal project) is a multi-year initiative by **BC Hydro** to **replace aging electrical equipment and control buildings** on a critical section of its high-voltage transmission system that runs from the **Peace Region** toward the south of BC.

Purpose and Importance

This project addresses **end-of-life and deteriorating equipment** to maintain reliable transmission of electricity from generating facilities in northeastern BC to major load centres. It helps support the **500 kV backbone transmission corridor** that is essential for moving large amounts of power across the province.

Key Work Components

BC Hydro's PKSP involves major renewals at several facilities, including:

- **Shunt reactors** at:
 - **Peace Canyon Generating Station**
 - **Williston Substation**
- **Series capacitor control systems** at:
 - **Kennedy Capacitor Station**
 - **McLeese Capacitor Station**

- **Replacement of control buildings at:**
 - **Kennedy Capacitor Station**
 - **Williston Substation**
 - Upgrading or replacing **voltage stabilization equipment** and other associated station infrastructure.
-

Locations Involved

Facilities and stations in the project are located along the Peace to Kelly Lake transmission corridor, including:

- Peace Canyon Generating Station
- Williston Substation (near Prince George)
- Kennedy Capacitor Station
- McLeese Capacitor Station
- Kelly Lake Substation

(See the project map for geographical context.)

Timeline

- **Construction started:** April 2023
- **Expected completion:** 2028
